

Discussion

- HEPI surveyed 1,041 full-time undergraduate students. Data shows 92% of students use GenAI, 88% for assessments.
- Digital Educational Council's report frames a 3-type model for assessment in the AI era: **AI-Free, AI-Assisted, and AI-Integrated**.
- Introduces **AI-resilience** as a baseline design principle: redesign structures (process evidence, authenticity) rather than relying on student compliance or detection.
- Calls for a shift from output-only grading to reasoning, process, and verification, with clear communication of when/how AI may be used.
- Notes **live or scenario-based elements** (e.g., short orals, role-play, in-class checkpoints) as scalable ways to support integrity and capture thinking.
- Nikolic et al. studied nine academics from seven Australian universities, all with different engineering backgrounds to investigate how assessments in different engineering subjects stood up against GenAI models.
- Study maps GenAI impact by assessment type and presents a risk matrix (likelihood × consequence) to rate tasks from *Low* to *Very High* risk; **online exams & programming** rated “almost certain” to be impacted, **in-person exams & class participation** least impacted.
- Introduces a “Generative AI Assessment Security & Opportunity Matrix” (**Table 10**) for 17 types of assignments.
- Khalif et al. propose a practical framework for redesigning assessments in the GenAI era built from workshops with 155 faculty.
- Introduce the “Against–Avoid–Adopt–Explore” decision model to choose when to prohibit, limit, allow with guardrails, or intentionally integrate AI (table 3)
- Recommends **AI-resistant designs** that grade reasoning and process (e.g., method/assumption justification, iteration, critique of AI output) rather than output alone; sample rubrics stress disclosure and verification.
- Walker et al. report GenAI achieves comparable mean performance to students across the curriculum, with markedly lower variance
- GenAI performance was somewhat unreliable when faced with ‘prove or disprove’ questions, in which it was tasked with deciding if a statement was true or not and providing a proof or counterexample.
- Proposes a faculty-tested framework for assessment redesign (authentic tasks, process evidence, verification).
