WHAT YOUR COLLEAGUES ARE DOING

■ Very satisfied (4)

MME · ME 1520, ME 281x (2810)

Let's learn about AI together. We all must learn what AI can do to help us with our engineering. AI can be helpful for learning, and it is becoming necessary for engineering work. We also need to learn what it is that we can do that AI cannot, if not AI will replace us. And we still need to learn how to learn how to do these things. We will all be doing this as long as AI keeps evolving, maybe the rest of our lives.

Please experiment with AI as much as you like. Please indicate on all submissions where you consulted with AI which program you used and how you prompted it.

AI can miss a lot and it just makes stuff up. Additionally, AI generated text can seem unauthentic and can be exceedingly verbose. It writes in a voice that does not read like something an engineer or engineering student would write.

MME / Mechanical Engineering · All undergraduate courses and MQPs

I encourage the use of AI in gathering ideation for designs. Outside of this simple statement I do not have a formal written policy.

MME · ME2300

I ask that my students collaborate as teams for their team-based weekly reports (presented live and as slide decks) but that they write individually for the final report. They receive one lecture about how to do library research (Lori from library) and they include the search info in their reports. I do not check their reports with an AI detector; I treat them as professional adults and expect them to behave accordingly.

MME · ME 3902 Engineering Experimentation

AI has become a standard tool in modern engineering practice, and this course treats it accordingly: as something to use thoughtfully, not avoid or outsource to.

The core principle: AI will scaffold your learning, not replace it. Every use of AI in this course must be something you can stand behind, explain, and defend as your own understanding.

Course Objectives and Where AI Fits:

1. Apply fundamental experimental techniques — AI not applicable
2. Integrate sensors, actuators, and microcontrollers — AI not applicable
3. Understand and apply principles of code architecture and flow — AI permitted (see below)
4. Design, assemble, troubleshoot electromechanical systems — AI not applicable
5. Develop and interpret calibration curves — AI not applicable
6. Model and verify mechanical systems — AI not applicable
7. Practice engineering problem-solving and teamwork — AI not applicable
8. Communicate technical findings effectively — AI permitted (see below)

Objective 3 — Code: AI permitted for brainstorming structure, debugging, optimizing, exploring alternatives. Not permitted: generating code you cannot explain. Enforcement: lab checkoffs and midterm require explaining/modifying code.

Objective 8 — Lab Reports: AI permitted for spelling, grammar, tone, organization. Not permitted: generating content, writing analyses, interpreting data. All ideas/results/conclusions must be your own.

Not allowed in any context: AI during quizzes/exams; data analysis; citing AI as source.

Disclosure: I use AI tools to refine course materials. All content reviewed and verified by me.

ECE · ECE503 Digital Signal Processing

AI-usage Policy for ECE503 (discussed with students in first meeting)

The use of AI tools in this course is governed by the following policies. These apply to all assignments, projects, discussions, quizzes, exams, and other course-related activities.

Permitted Uses:

- Research and brainstorming: Students may use AI tools to explore ideas, gather background information, or generate initial outlines, provided they critically evaluate and cite any AI-generated content.
- Self-assessment: Students may use AI to generate questions to test their understanding of the material, e.g., ChatGPT Study Mode.
- Writing support: Grammar and style suggestions from AI tools are allowed for drafts, but final submissions must reflect the student's own understanding and voice.
- Coding assistance: AI tools may be used to help debug or optimize code, but students must understand every line they submit.

Prohibited Uses:

- Generating solutions to graded assignments, projects, or exams.
- Submitting AI-generated text or code as original work without disclosure.

All AI use must be disclosed in a standard format. Exams are AI-free.

MME · ME5371, MTE/MFE 5843 and ME5370, MTE/MFE 5841

Without a lot of specific prompting, that requires good knowledge of the course material, I have not been able to get Microsoft Copilot to be helpful in doing anything for the term project in this class. This course emphasizes the value on discovering functional correlations between topographies and performance, for product design, and between processing and topographies, for archaeology and product design. This course emphasizes multiscale geometric analyses (aka fractal analyses), which were developed primarily at WPI. These appear to be the most effective way to find functional correlations and to discriminate with confidence between surfaces that were processed differently. Length, area, slope, and curvature are all geometric parameters that naturally vary with scale on real surfaces.

■ Neither (3)

Manufacturing Engineering · MFE 511

AI use policy:

AI tools are allowed to be used in literature search and review, concept explanations, and improve writing quality. AI tools are not allowed to be used in quizzes and exams.

MME · ME500 and ME3902

Course Policy on the use of Generative AI

In this course, you are welcome to use generative AI, including OpenAI's GPT models, to support your learning. In particular, you are welcome to use these models to get help on your HW, project, and whenever otherwise is stated. Exams will be closed book, closed notes, and these include generative AI models too. We will discuss about the proper use of AI in our lectures through the semester.

Below, you can find further information for instructions of using AI, and as well as, short ethical considerations on the AI technology in general.

As a new developing technology and like its predecessors, Large Language Models (LLMs) are rapidly evolving technologies. We don't know yet when and if LLMs will replace humans in their jobs. However, it is your responsibility to control the learning process and maintain your own abilities and thinking skills in parallel with using AI.

MME · ES 2501 Statics

AI is not permitted on homework.

Separately, a bonus worth at least as much as a homework assignment can be awarded for a short write-up demonstrating doing something useful and relevant for class with AI. The value of the bonus will depend on the innovativeness and scope of the demonstration.

CEAE · CE590

Below is the policy from my graduate class in the Fall. I should mention that this policy was useless. The homework assignment was to find a paper on a topic the student is interested in, and is related to class, and produce a 2 page summary. Well over half of students were very obviously finding a paper, feeding it into AI to get a summary, and submitting it as their homework. They didn't even read it. I was able to file a judicial complaint against one student because he actually left the prompt in his homework. For the others, I did not have sufficient proof, but it was obvious. I am genuinely disappointed that I simply cannot assign writing assignments for homework any more.

"Generative AI Policy: AI does have some limited legitimate uses in a course like this. Some platforms can help you search literature and compile references. You may use AI as a research aid, but you must be careful to independently verify any information produced by AI before including it in your own work. You may not use AI to generate any text that you present as your own writing. Any student submitting AI-generated text as their own work will be referred to the Office of Student Affairs and will receive a minimum grade of zero for the assignment."
